## VX165-90

Extreme Low Temperature FKM

## Meeting the Industry Need for $-65^{\circ} \mathrm{F}$ Sealing:

Facing the demanding requirements of the Oil and Gas industry, VX16590 delivers not only extreme low temperature performance needed in arctic environments but also great high temperature stability and low compression set values. Along with great physical properties, chemical compatibility, rapid gas decompression and sour service $\left(\mathrm{H}_{2} \mathrm{~S}\right)$ resistance, VX16590 significantly extends seal life in applications where a variety of other materials have been used. These characteristics make VX165-90 the ideal material when looking for great all around properties from an FKM.

- Wide Temperature Range: $-65^{\circ} \mathrm{F}$ to $400^{\circ} \mathrm{F}\left(-54^{\circ} \mathrm{C}\right.$ to $204^{\circ} \mathrm{C}$ )
- Excellent Compression Set Resistance
- Extreme Low Temperature Performance

- 90 Shore A Durometer
- RGD Resistant
- $\mathrm{H}_{2} \mathrm{~S}$ Resistant per ISO 23936-2

## VX165-90 Test Data

## Extreme Low Temperature

Traditionally, FKM compounds are known for great thermal stability at high temperatures. The VX165-90 is no different with very minimal change in physical properties and low compression set values at $392^{\circ} \mathrm{F}\left(200^{\circ} \mathrm{C}\right)$. However, what sets VX165-90 apart from the competition is the ability to perform at extremely low temperatures as well. With a TR- 10 value of $-52^{\circ} \mathrm{F}\left(-47^{\circ} \mathrm{C}\right)$ the temperatures as well. With a TR- 10 value of $-52^{\circ} \mathrm{F}\left(-47^{\circ} \mathrm{C}\right)$ the
VX165-90 compound is reliable for static sealing needs down to $-65^{\circ} \mathrm{F}\left(-55^{\circ} \mathrm{C}\right)$ which is nearly $50^{\circ} \mathrm{F}$ lower than standard A-Type FKM.

Excellent Chemical Resistance

As expected from the FKM class of elastomers, VX165-90 maintains excellent compatbility with typical fluids and media seen in Oil and Gas environments. Offering excellent resistance to petroleum oils and hydrocaretroleum oils and hydrocarbons as well as improved resisance to more aggressive media ike hydrogen sulfide $\left(\mathrm{H}_{2} \mathrm{~S}\right)$ and Methanol make the VX165-9 seful in a broad spectrum of applications.

## Rapid Gas Decompression

Applications which utilize high pressure gas venting techniques exposing the elastomeric component to high pressure then low pressure over a short period of time is very aggressive. Rapid Gas Decompression (RGD) resistance can be a root cause of severe damage to elastomers in application causing leakage. RGD damage is caused by the release of high pressure gases tearing their way out of an elastomeric component resulting in internal voids, fissures, blisters and splits of the seal. The VX165-90 compound can withstand these rapid decreases in pressure without significant damage to the seal providing long service life in the application.
